

What is claimed is:

1. A crawler type traveling apparatus so arranged on each side of a vehicle as to be capable of rocking up and down through each pivot shaft, comprising:

a track frame rocking around said pivot shaft; and

a final reduction gear inclusive of a sprocket and a hydraulic motor that are provided at an end part of said track frame,

wherein said hydraulic motor is arranged against said final reduction gear close to the inside of said vehicle.

2. The crawler type traveling apparatus according to claim 1, further comprising hydraulic passages inside said pivot shaft to communicate with said hydraulic motor.

3. The crawler type traveling apparatus according to claim 2, further comprising ports on an outer peripheral surface of said pivot shaft for respectively connecting a required number of hydraulic piping arrangements to said hydraulic motor.
